High Level Overview, Introduction & Goal

Our restaurant receives large, pre-scheduled food orders called Group Orders, where many individual meals are bundled together and sent to us as a single order. These orders come from seven different platforms (such as Grubhub, Sharebite, and EzCater).

Right now, these platforms do not connect directly to our point-of-sale system (Atmos). Instead, they send us PDF files that look different for every platform. Someone on our team must read each PDF, figure out who ordered what, and manually enter every item, modification, guest name, pickup time etc into a format that Atmos interprets and uses.

This process is slow, repetitive, and vulnerable to errors.

Our goal is to build a system that can accept PDF uploads, automatically read and extract all necessary information, correctly split and combine orders, and then place everything into one clean, standardized format. That final output should be sent to us as a Google Sheet, Excel file, PDF, and link—ready to be uploaded or printed.

Some PDFs contain:

- A summary page with high-level details
- Label pages showing each guest's name and items
- Spreadsheet-style pages with full breakdowns
- Or sometimes several completely different orders inside a single PDF

This system must also be flexible, so new platforms or new PDF formats can be added in the future without rebuilding everything from scratch.

Later in this description we will be providing specific links to a dashboard with links to both unedited and marked up PDF orders to show how we will be uploading information and what information needs to be harvested. Then we shall also provide a separate link to a template sheet that demonstrates the goal of how we want the information to be formatted and shared back to us.

**** indicates a word with specific definition as defined on the last page under the Key Terms & Definitions Section.**

---

1. What Is a Group Order

A **Group Order** is a collection of one or more individual guest orders combined by an external platform and submitted to us as a single group order.
These orders **are not currently integrated** into Atmos**, our point of sales system; they arrive as **PDF files** and require manual entry.

---

2. Platforms

We currently receive Group Orders from the following seven platforms:

- Grubhub , Forkable , Sharebite , CaterCow , EzCater , ClubFeast , Hungry

Each platform provides order PDFs in a **unique format**, but the **core data points** we need to extract are consistent across all platforms.

---

3. Order Composition

We need the system to support multiple PDF uploads for a single group order, because platforms often provide the order information in several separate files. In some cases, a single uploaded PDF may also contain multiple group orders mixed together, so we need the ability to split those apart.

Group order documents come in **three main formats**:

1. Cover Sheets** – usually contain the high-level order details (client name, delivery time, etc.).
2. **Order Labels** – individual guest or item**-level labels that need to be rendered one per item**.
3. **Order Excel Sheets (PDF exports)** – spreadsheet-style breakdowns of every item in the order.

Because every platform formats their PDFs differently, we need flexibility:

- Sometimes **Cover Sheets** and Order Labels** are combined into a single PDF
- Sometimes the platform only provides **Cover Sheets**, and no labels at all.
- Sometimes the PDFs come **separately** (e.g., one PDF for Excel-style sheets, another for labels).
- Occasionally, **one PDF contains multiple completely different group orders**, which must be separated and processed individually.

The system must therefore:

- Accept **multiple PDFs per order**
- Allow us to **identify and split** separate orders inside one PDF
- Correctly detect and process **each document type** (Cover Sheets, Labels, Excel-style sheets)
- Combine the extracted information into **one clean, structured output** for processing and printing

A Group Order is made up of **Individual Guest Orders**, and each guest order may contain one or multiple items. When a guest orders multiple items, **each item must be treated as a separate line item**, all linked to the same guest name.

Example:

If John orders a **Crispy Caesar**, a **Chicken Shawarma Bowl**, and a **Coca-Cola**, the system should generate **three separate items**, each tagged with the guest name **John**.

4. Data Fields to Extract

Below is the complete list of information the system must extract from each **Group Order**.
Fields are divided into **Order-Level Data** and **Guest-Level Data**, with explanations for each.

<u>Order-Level Information</u>

A. Business Client

We work with seven platforms that send us group orders:
Grubhub, Forkable, Sharebite, CaterCow, EzCater, ClubFeast, Hungry

Each platform must be mapped to its standardized **Business Client Name**:

The Name that you see listed for the platform needs to be assigned the matching business client name as described in the following table.

Platform	Business Client Name
Grubhub	Group – Grubhub
Forkable	Group – Forkable
Sharebite	Group – Sharebite
CaterCow	Group – CaterCow
EzCater	Group – EzCater
Hungry	Group – Hungry
ClubFeast	Group – ClubFeast

Every order or sub-order must be associated with one of these.

B. Client Name

The company placing the order (e.g., **Yext, Apple, Google, Microsoft**, etc.).

C. Client Information

Any available company-level contact information:

- Address , Phone number, Point of contact, Email(s)

D. Group Order Number

A **unique identifier** for the order as provided by the platform.

Important:
Some platforms bundle several orders together.
If multiple Group Order Numbers appear inside a single file, **each one must be treated as its own individual order**, even if they belong to the same client.

E. Group Order # – Pick Time or Delivery Time

Each Group Order Number has a **specific pickup time or delivery time**, which tells us when the order is expected.

This may appear: On the cover sheet** , the order label** , or in the Excel-style sheet
The system must extract and associate pickup times correctly.

F. Order Subtotal

Total cost of all items in the order.
Notes:

- Extract **subtotal only**
- Do **not** include tax, service fees, delivery fees, or miscellaneous charges

---

G. Requested Pick-Up Date

The date the order is scheduled for (not the date the PDF was generated).

H. Number of Guests

Indicated by:

- A count shown on the platform **OR**
- The number of **unique guest names** identified in the labels or item table

---

I. Delivery

Whether the order is scheduled for:

- **Pickup**, or
- **Delivery**

Note: Some clients default to a specific mode (e.g., automatic pickup), so the system should not override platform-specific defaults without clear data.

Individual Guest Order Information

A. Group Order Number

Same field as above, but required again at the **item line level** for grouping and assigning.

B. Guest Name

The individual's name, as this is how recipients identify their items.
Example formats the system must recognize:

- "John Smith"
- "John S."
- "Smith, John"
- Initials + name combinations (varies by platform)

C. Item Name

Exactly what the guest ordered. Entire unique components on an order like Bowls, Salads, Sauces Desserts, Drinks etc

---

D. Modifications

Any **structured changes** the guest selected, such as:

- "No Sumac Onions"
- "Half Romaine / Half Greens"
- "Baked Falafel"

Important:
Modifications ≠ Comments.
Modifications affect the build; comments do not.

E. Comments

Guest-provided notes that do **not** change the actual build of the dish.
Examples:

- "Please double bag if possible"
- "Allergy: prefers no spice"
- "Leave at front desk"

These must be captured separately from modifications.

Additional Note

For all seven business clients, we have prepared detailed examples showing *exactly where* each piece of information should be harvested from each PDFs across their various formats.

When you open this link you will see columns headed by the Business Client Name, with links directly beneath them. These links include an unmarked version of the PDFs so you can see how the information would be submitted to the system, and then directly underneath a link to a marked up version with annotated markings that show where and what information can be harvested.

In the top section of this Dashboard you can see the examples. It is important to understand that some companies provide multiple documents that contain critical information for the whole order in both documents.

Therefore, in the second section titled “Info Source - Where to find the information” the dashboard shows where to harvest the information from each document.

Some companies do not provide a complete set of information, the goal is to harvest all the relevant information we can, and translate it into a format our POS system can later use.

Business Client Name	Group - Grubhub	Group - Sharebite	Group - Forkable	Group - CaterCow
Link to Unedited Example	Grubhub Order - Clean	Sharebite Example Unedited	Forkable Excel - Clean	CaterCow Cover Sheet - Clean
Link to Mark Up Copy	Grubhub Order - MarkUp	Sharebite Example MarkUp	Forkable Excel - MarkUp	CaterCow Coversheet - MarkUp
Link to Unedited Example			Forkable Labels - Clean	CaterCow Labels - Clean
Link to Mark Up Copy			Forkable Labels - MarkUp	CaterCow Labels - MarkUp
				Info Source - Where to find the information
				Order Information
Business Client	Cover Sheet	Cover Sheet	Order Labels	Cover Sheet
Client name	Cover Sheet	Cover Sheet	Excel Sheet	Cover Sheet
Client Information	Cover Sheet	Cover Sheet		Cover Sheet
Group Order Number #		Cover Sheet	Excel Sheet & Order Labels	Cover Sheet
Group Order # - Pick Time		Cover Sheet	Excel Sheet	
Order Subtotal	Cover Sheet	Cover Sheet		
Requested Order Time	Cover Sheet	Cover Sheet		Cover Sheet
Requested Pick Up Date	Cover Sheet	Cover Sheet	Excel Sheet	Cover Sheet
Number of Guests	Cover Sheet	Cover Sheet		Cover Sheet
Delivery	Cover Sheet	Cover Sheet		Cover Sheet
				Individual Order Information
Group Order Number #		Order Labels	Excel Sheet & Order Labels	
Guest Name	Order Labels	Order Labels	Order Labels	Order Labels
Item Name	Order Labels	Order Labels	Order Labels	Order Labels
Modifications	Order Labels	Order Labels	Order Labels	Order Labels
Comments	Order Labels	Order Labels	Order Labels	Order Labels

A link to that dashboard is provided here:
[Link to order information harvesting examples.]

This dashboard includes:

- Sample PDFs
- Highlighted extraction points
- Format variations
- Source references

5. Target Format for processed group orders

Here we are going to link to a spreadsheet titled Final Group Order Format Template.

This spreadsheet is designed to show how we want the harvested information from group orders to be translated and filled in for our system to use.

Not all fields will be filled in depending on whether a specific business client provides that information.

Every order that gets submitted will need to generate its own workbook with the named fields and the information that has been harvested.

In this template workbook we are showing the general format in two ways.
In the first tab of the workbook called “Explanation” we have the fields listed with a short highlight and description for the different fields.
In the other tab labeled “Example” we have a short fictional example with fields filled in to show how it would look with information filled in.

Upon completion of a workbook meaning all harvested information has been filled in, the workbook needs to be renamed using the following format and the tab also needs to be named the same :
[Business Client] - [Requested Date] - [Number of Guests]
Example:
Forkable - Group - November 23, 2025 - 34

	A	B	C	D	E	F
1						
2	**Main Order Information**					
3	Business Client	Group - Sharebite				
4	Client name	Yext				
5	Client Information	91 1st Avenue				
6	Order Subtotal	$197.78				
7	Requested Pick Up Time	10:30 AM				
8	Requested Pick Up Date	12/10/25				
9	Number of Guests	9				
10	Delivery	**Sharebite**				
11						
12		**Group Order**				
13		Group Order Number #	FI 7			
14		Group Order # - Pick Time	10:00 AM			
15						
16			**Individual Order 1**			
17			Group Order Number #	90210		
18			Guest Name	Bob		
19			Item Name	Chicken Shawarma Bowl		
20			Modifications	Jasmine Rice	Tahini Yogurt	No Serranos
21			Comments	I like food		
22						
23			**Individual Order 2**			
24			Group Order Number #	90210		
25			Guest Name	Behmet		
26			Item Name	Protein Meal		
27			Modifications	Beef Kebab	Greek Chicken Kebab	Farro
28			Comments	Extra Rice		
29						
30			**Individual Order 3**			
31			Group Order Number #			

And then it needs to be emailed as an excel & PDF to eatcon@terra-ny.com .

The Subject needs to be formatted like this:
Group Order Submitted - [Business Client] - [Requested Date] - [Number of Guests]
Example:
Group Order Submitted - “Forkable - Group” - November 23, 2025 - 34

Explanation | Example

[Link to Template Format]

There is a Explanation Tab & an Example Tab for the formatting

6. Target System Behavior

The new system should:

1. **Accept PDF uploads** from any of the seven supported platforms by self upload
2. **Extract key data** automatically (see Section 4).
3. **Format and transmit the data** to our compatible structure. (see Section 5)
4. **Create final google sheet with the formatted data**
5. **Automatically Send final google sheet as an Excel, PDF and Link to a specified email.**

   The System needs to be built dynamically so new templates (Business Clients with unique formats) can be introduced.

Key Terms & Definitions

- Atmos - The unique point of sales system we use to collect and display all order information.
- Items - Entire unique components on an order like Desserts, Drinks, Bowls, Salads, Sauces etc
- Modifiers - Customization options that can be applied to a main **item**
- Cover Sheet - The main page of an order that contains information applying to all the orders in general *Note not all companies provide a coversheet, some provide the critical information on the individual order level (stickers)
  Stickers
- **Order Labels** – individual guest or item**-level labels that need to be rendered one per item**
